MANNER OF CUTTING STAKES

Trouble Avoided in Driving Bean Poles If Care is Taken to Sharpen the Ax Properly.

When sharpening the ends of bean poles and other stakes to enable them to enter the ground couly it takes several blows with the batchet to obtain the desired effect.

All this trouble may be entirely done away with if you take care to sharpen the ax properly, says the Scientific American. When sharpening an ordimary ax or hatchet you first put one side against the grindstone and then the other, thus making a bevel on both sides as in Fig. 1. But, instead of doing this, allow one side of the hatchet to lie nearly flat on the grindstone. Then lay the other side on the stone and put a bevel on it in the ordinary way. Now the hatchet has an edge like a wood cutting chisel (Fig. 2). When pointing stakes let the flat surface, which must be the left side when the edge is pointing away from you, be nearest the wood.
